

## SR650-50 impulser for slaves

The SR650-50 is an electronic master clock for bipolar slave clocks, synchronising to the mains frequency (50Hz).

Because this frequency is a little bit floating the clock is running sometimes a little fast or slow, but in average always on time. The SR650-50 is more than a simple divider of the mains frequency. Short cuts of the mains don't have effect and suppression on the mains does not lead to extra counting. No automatic DST and no correction of the clock(s) as soon as the mains has been restored after a mains failure.

### Technical data

- Led indication of the 50Hz signal and the clock line.
- Multifunctional push button for a manual synchronised start of the clock(s) to the real time.
- Function set up with dip-switches.
- Minutes, 30 seconds or seconds impulses.
- Impulse length minutes/30 seconds: 0.6 or 2 seconds. Seconds impulses 0.6 seconds.
- Mains voltage: 230V/50Hz.
- Clock line: 24V=60mA, bipolar.
- Housing: polycarbonate, with transparent cover.
- Dimensions (lxwxh):130x80x50mm. With strain reliefs: + 20mm.

Prices, see pricelist SR series.
